Profile

I design and ship LLM products end to end — data model, backend, queues, UI, integrations, deploy — and run them in production. I build with AI coding agents at team speed, inside a quality contour I designed (specs, 22 hard-capped gates, a doctor that audits the gates themselves); architecture, contracts and the final review stay mine. That is how two client services went from first commit to production in 8 and 14 days.

What I bring

- **LLMs under control, not just connected.** Behavioral contracts as versioned specs: hard rules block a message, soft rules force a rewrite, a drift score watches both, a kill switch needs no restart. Autonomy is earned by measurement, not trust: shadow runs on real mail score every draft before anything is sent on its own.
- **Speed without shortcuts.** Size-capped spec → plan → verify slices; gates that block the merge (strict typing, import-layer contracts, ratchets that only tighten); every live failure becomes a test. The same contour runs in 7 repositories.
- **Cost engineering for paid APIs.** Pre-run estimates, fail-closed quota checks, caching and per-request cost ledgers: live probes showed a vendor's documented pricing was 9× too low, and a three-stage filtering funnel cut projected spend by 47%.
- **Evaluation discipline.** Held-out sets with a ledger of every look, predictions written before the run, retrieval calibrated against a public benchmark (BM25 nDCG@10 0.666 vs a 0.665 anchor), golden sets behind LLM judges.
- **Private, local AI.** Ollama-based agents that never leave the laptop: a browsing research agent and a voice interviewer whose first word lands ~1.3 s after your turn ends.

Selected work

- **LinkBuilder — outreach CRM** (*production, sole engineer*). One operator runs what took a team of five: competitor mining, site-quality gates, mass outreach, AI-drafted replies under 10 versioned contracts, payments, and monitoring of 16,000+ placed links. 11,000+ backend and 700 frontend tests, 137 migrations, 20+ queue workers.
- **SEO case-study platform** (*production, client under NDA*). Ahrefs history → classification → one-page PDF case studies. First commit to production in 14 days against a 4–4.5-week estimate; 959 tests; crash-safe paid runs that never pay twice for the same data.
- **Prospecting & outreach platform** (*production, client under NDA*). GPT-5 site classifier, PII-masked letter rewriter and reply-price extraction, each behind an eval gate. Kickoff to production in 8 days: ~100 merged PRs, 2,100+ tests.
- **G connect — MCP server** for Google Sheets and Drive, so Claude Code and Cursor agents can edit safely: 6 tools, 34 policy rules enforced in code, preview-first writes confirmed by plan hash, snapshot undo. Built in 8 days, 400+ tests.
- **Local Web Agent · Voice Interview Coach · RAG over a rulebook.** An on-device agent that browses real sites and answers only with what it can quote (443 tests); an offline voice interviewer with a per-sentence contract; retrieval with zero uncited answers.

Experience

Bookmaker Ratings — AI Automation Engineer / Internal Tools Builder · Aug 2021 — Present · Remote

- Built and owned LinkBuilder in production: architecture, refactor waves, human-in-the-loop design, and a handover document that describes the live state of the system, not its design.
- Built content automation: ~5× faster content preparation, ~120 hours a month saved. SEO background: grew organic traffic from 30–40K to ~180K monthly visits (Brazil, Portugal).

Skills

Backend: Python, FastAPI, asyncio, SQLAlchemy 2, Pydantic, Alembic, PostgreSQL, Redis/RQ, Node.js · **Frontend:** React, TypeScript, Vite, Mantine, TanStack Query · **AI:** OpenAI API, Ollama, tool calling, MCP, behavioral contracts, HITL, evals, RAG, ASR/TTS · **Delivery:** Claude Code, Cursor, pre-commit gates, GitHub Actions, Docker, Playwright, pytest, Vitest, mutation testing

Education: Saint Petersburg State University of Service and Economics, 2014
